To: Our Valued Client

RE: Energy Star version 3 – the upcoming changes

The team here at DuctTesters would like to congratulate your company on the success you have had with the Energy Star program. It truly is an honor to work with the area's top builders and watch them push the market toward high efficiency homes. The marketing power behind the Energy Star label is one that has brought great recognition to your homes and we are grateful to be a part of your team bringing this prestigious label to your homebuyers.

The near future holds yet another substantial change to the industry, this time via the changes coming to the Energy Star program. The current Energy Star program (version 2.0) is set to expire on July 1st 2011. This has been a very successful program and we hope that you feel your participation in the program has brought recognition and value to your homes. As the Energy Star program goes through this update process, we want to assure you that DuctTesters is up to speed with all the changes and can continue to be your go to source for answering all your questions. The purpose of this letter is to inform you of the major changes that will need to be implemented in order to continue participation in the Energy Star version 3 program.

Size Adjustment Factor

The performance approach that the Energy Star program has been using provides the flexibility to select a custom combination of measures for each home that is equivalent in performance to at least 15% better than the California 2008 Building Energy Efficiency Standards. This is the typical energy analysis that DuctTesters has been providing you as part of our Title-24 services.

Version 3 introduces the "Size Adjustment Factor", which aims to keep home sizes to a moderate size and in line with the benchmark home define by the EPA. So essentially, you are being penalized for building an excessively large house. The adjustment happens to the percentage over Title24 standards that needs to be reach for that particular home. The minimum savings target remains at 15%, but as the homes size increases, the Size Adjustment Factor is applied and adjusts the required savings target for that particular home. The larger the home, over the define benchmark home, the higher the required savings target is set. The benchmark home is defined in Exhibit 2 below.

Exhibit 2

Energy Star Version 3 Benchmark Home								
# of Bedrooms	1	2	3	4	5	6	7	8
Condition Floor Area	1,000	1,600	2,200	2,800	3,400	4,000	4,600	5,200

For builders use to building larger homes, this could have a significant impact on the participation in the Energy Star program. The average 3 bedroom home has to be less than 2200 square feet to fall under the 15% savings target.

Inspection Checklists

Energy Star version 3 brings about a new set of inspections checklists as a prerequisite for qualification. A qualifying home must meet the requirements of the follow checklists:

- Thermal Enclosure System Rater Checklist
- HVAC System Quality Installation <u>Contractor</u> Checklist
- HVAC System Quality Installation Rater Checklist
- Water Management System <u>Builder</u> Checklist (or Indoor airPLUS Verification Checklist)

These checklists are above and beyond the CF-6R or CF-4R documentation that is required per the Title-24 requirements. The implementation of these checklists is similar to the previously required *Thermal Bypass Checklist*.

The Rater is required to keep electronic or hard copies of the completed and signed checklists. The signature of the HVAC technician is required if any of the HVAC equipment specified on the HVAC System Quality Installation Contractor Checklist is installed in the home.

All checklists, including the HVAC System Quality Installation Contractor Checklist and Water Management System Builder Checklist may be completed for a batch of homes using a RESNET-approved sampling protocol to qualify homes as ENERGY STAR. For example, if the approved sampling protocol requires rating one in seven homes, then all of the checklists must be completed for the one required rating.

Thermal Enclosure System Rater Checklist

The Rater must review all items on the Rater checklists, with the exception that the <u>builder may assume responsibility for verifying a maximum of eight items</u>. This option shall only be used at the discretion of the Rater. When exercised, the builder's responsibility will be formally acknowledged by the builder signing off on the checklist for the item(s) that they verified. This particular checklist is very similar to the previously required *Thermal Bypass Checklist*, so it should not have much surprise to it.

Items of Attention

- 2.2 All ceiling, wall, floor, and slab insulation shall achieve RESNET-defined Grade I This requirement is making the Title-24 QII credit a requirement.
- 3.x Fully-Aligned Air Barriers

 This requirement is the standard "6 sided assembly, to ensure insulation is in contact with an air barrier for maximum performance.
- Insulated ceilings with attic above have insulation extending to the inside face of exterior wall at the R-21
 Note that these requirements can be met by using any available strategy, such as a raised-heel truss, alternate framing that provides adequate space, and/or high-density

insulation. One option that will work for most homes is to use 2x6 framing, an R-21 high-density batt, and a wind baffle that only requires 0.5" of clearance.

- 4.3 Insulation beneath attic platforms > R-21This is a slight change, but one the insulation contractor will need to pay attention too.
- 4.4 Reduced Thermal Bridging at Walls
 This is met by using Continuous Rigid Foam (2 coat stucco) and or insulated siding, OR
 SIP Walls, OR ICF Walls, OR Double Wall Frame, OR Advanced Framing
- 5.2.3 Sheetrock sealed to top plate
 Foam or Caulk only, construction adhesive is not allowed

HVAC System Quality Installation Contractor Checklist

As usual, the HVAC system is getting a lot of attention in the Energy Star program. A lot of the new requirements have already been implemented in California through the CALGreen requirements.

Items of Attention

- 1.1 Ventilation system needs to be designed to meet ASHRAE 62.2-2010 requirements

 The current California adopted version is 2007, so there may be a few slight changes.
- 2.x Heating and Cooling System Design

 This section of the checklist requires the documentation of a lot of the information used in a load calculation. It requires a proper Manual J Load calc, Manual D duct layout, and Manual S equipment selection.
- 3/4/5 Equipment Documentation

 These sections are used to document the specific equipment installed. Much like the California CF-6R documents, but it has a few extra bits of information required.
- 6/7 Refrigerant Charge
 This will make the HERS Refrigerant Charge testing required for all homes
- 8.x Electrical Measurements

 This is essentially the HERS Fan Watt Draw Verification being required.
- 9.x Airflow TestsThis is HERS Airflow Verifications being required, with a few more data collection items.
- 10.x Air Balancing

 This is verification that airflow to each room is meeting the Manual D designs done

HVAC System Quality Installation Rater Checklist

This is a HERS Rater review of the Contractors Checklist and installation

Items of Attention

1.1 Collection of Contractor documentation

Rater required to collect completed checklist, ventilation system documentation, load calculations, AHRI certificate, and air balancing report

1.3 Rater Verified Duct Static Pressure

This is an additional verification required by the rater.

2.8 Bedrooms pressure balanced

This is an item not specifically addressed on the Contractor list. Typically under cutting doors does not meet this requirement, so transfer duct will have to be used.

4.2 Rater measures duct leakage to outside

This is NOT the normal Duct Leakage test the rater performs, this is a combination of blower door testing and Duct leakage testing.

5.1 Rater Measured Ventilation Rate

Rater must verify the ventilation rate is as designed by contractor.

6.x Rater Tested Controls

Rater required to verify the operation of the fan, cooling, heating, and ventilation equipment on/off controls

7/8/9 Rater Verified Ventilation

Rater to verify ventilation inlet locations, Local exhaust cfm rates, and ventilation fan sound ratings

10.x Combustion Appliances

If combustion appliances are inside the building envelope, the Rater must conduct a Combustion safety test. Applies to atmospherically vented appliances

Water Management System Builder Checklist

Water management is a new addition to the Energy Star program. All though it does not specifically address energy, it does play a critical role in longevity of the home. So it only makes sense to include it, saving energy in the home doesn't go as much of a selling point if the home is destroyed by water leakage. This is completed by the Builder.

Items of Attention

- 1.3 Capillary break beneath all slabs poly sheeting must be in direct contact with the concrete slab
- 3.3 Self-Sealing bituminous membrane at all valleys and roof deck penetrations

The Transition Period

Starting July 1st, 2011 there will be a 9 month transition period until April 1, 2012. During this transition, the Energy Star program will be referred to as version 2.5 and apply to all homes with a "Completion Date" within this timeline. The "Completion Date" is defined as the date the final inspections are completed for the home. The version 3 changes mentioned below will only be enforced on limited basis during this version 2.5 transition period. During the version 2.5 only the "Air Barriers" and "Air Sealing" sections of the "Thermal Enclosure Checklist" will be required, all other checklists will NOT be enforced until version 3 is fully implemented on April 1st, 2012. However, we will be recommending the completion of the new checklists and working with the contractors to do so during this transition.

More Information

DuctTesters is always striving to make sure our clients have the most up to date information about all the industry news and happenings. Please feel free to contact us at any time to ask any questions you may have. As a valued client of ours, we are also offering to schedule an inperson or web meeting with your staff too further explain the changes. Please contact us to schedule a meeting ASAP.

We can be reached at 209.579.5	5000 or email one of our consi	ultants.

DRAFT ENERGY STAR Qualified Homes, Version 3 Program Requirements for the State of California

These guidelines may only be used in the State of California

Qualifying Homes

The following homes are eligible to earn the ENERGY STAR:

- Single-family homes;
- Units in multi-family buildings that are three stories or less;
- Units in multi-family buildings that are four or five stories and have their own heating, cooling, and hot water systems, separate from other units

Homes may earn the ENERGY STAR using the following ENERGY STAR Performance Path in the State of California. There is not a Prescriptive Path for the State of California. Note that compliance with these guidelines is not intended to imply compliance with all local code requirements that may be applicable to the home to be built.¹

ENERGY STAR Performance Path

The performance path provides flexibility to select a custom combination of measures for each home that is equivalent in performance to at least 15% better than the California 2008 Building Energy Efficiency Standards. Equivalent performance is assessed through energy modeling. Follow the steps below to use the performance path:

1. For all single-family detached homes, townhomes, rowhomes, duplexes and triplexes, calculate the Size Adjustment Factor (SAF) using the following equation:

Where:

CFA Benchmark Home = Conditioned Floor Area of the Benchmark Home, using Exhibit 2 below

CFA Home to be Built, as calculated using RESNET Standards

Because the SAF cannot exceed 1.0, it only modifies the California ENERGY STAR Savings Target for homes with conditioned floor area greater than the Benchmark Home. For condos and apartments in multi-family buildings the SAF shall always equal 1.0.

2. Calculate the target energy savings, rounded to the nearest whole number:

California ENERGY STAR Savings Target = 1 - [SAF x [100% - 15%]]

- 3. Using a computer program designed in accordance with the California Code of Regulations: Title 24, Part I, Article I, Section 10-109, configure the preferred set of energy measure for the rated home and verify that the results meet or exceed the California 2008 Building Energy Efficiency Standards requirements by the California ENERGY STAR Savings Target.
- 4. Construct the home using the measures selected in Step 1 and the Mandatory Requirements for All Qualified Homes, Exhibit 1.
- 5. Using a Rater, verify that all requirements have been met in accordance with the Mandatory requirements for All Qualified Homes and with RESNET's On-Site Inspection Procedures for Minimum Rated Features.²

Mandatory Requirements for All ENERGY STAR Qualified Homes in California

All ENERGY STAR Qualified New Homes must meet the requirements of the checklists in Exhibit 1. The Water Management System Builder checklist is not required for homes that also qualify for Indoor airPLUS.³

Exhibit 1: Mandatory Requirements for All Qualified Homes

	Area of Improvement	Mandatory Requirements
1.	Thermal Enclosure System	Completed Thermal Enclosure System Rater Checklist
2.	Heating, Ventilation, & Air Conditioning (HVAC) System	Completed HVAC System Quality Installation Contractor Checklist Completed HVAC System Quality Installation Rater Checklist
3.	Water Management System	Completed Water Management System Builder Checklist (or Indoor airPLUS Verification Checklist) ³

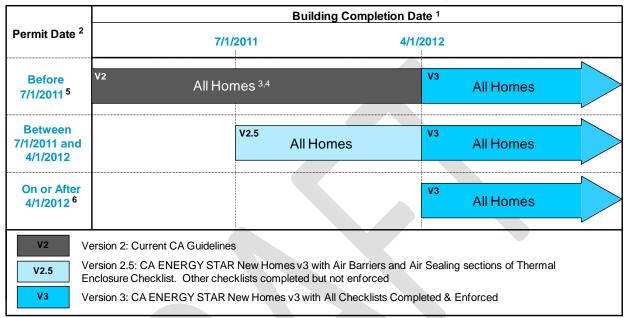

DRAFT ENERGY STAR Qualified Homes, Version 3 Program Requirements for the State of California

These guidelines may only be used in the State of California

Exhibit 2: Benchmark Home^{4,5}

Bedrooms in Home to be Built	1	2	3	4	5	6	7	8
Conditioned Floor Area Benchmark Home	1,000	1,600	2,200	2,800	3,400	4,000	4,600	5,200

Exhibit 3: California ENERGY STAR New Homes Version 3 Implementation Schedule

- 1. The date of the final inspection for the home (i.e., the date at which all of the field inspections are complete for the home, not necessarily the date when the label is issued).
- 2. The rater may define the 'permit date' as either the date that the permit was issued or the date of the contract on the home.
- 3. All low-income projects fin anced through low-income housing agencies may earn the ENERGY STAR under the last iteration of the guidelines, Version 2, until April 1, 2013 as long as the application for funding for those homes was received by the low-income housing agency before July 1, 2011 and the housing project includes at least one unit reserved for low-income tenants. If the application for funding is received between July 1, 2011 and April 1, 2012, then the homes must earn the ENERGY STAR under the Version 2.5 guidelines if completed before April 1, 2012, and under the Version 3 guidelines if completed after April 1, 2012. If the application for funding is received on or after April 1, 2012 then the homes must earn the ENERGY STAR under the Version 3 guidelines.
- 4. EPA recommends, but does not require, that Raters complete the v3 inspection checklists.
- 5. Homes can be qualified under the Version 2.5 guidelines in advance of the dates above at the discretion of builders and theirraters. However, homes may not be qualified as Version 3 until April 1, 2012.
- 6. Where a utility or state sponsor is man dating or incentivizing early adoption of Version 3 in their area, EPA will allow the labeling of ENERGY STAR Version 3 prior to April 1, 2012 on a pilot programbasis, provided that the sponsor meets certain requirements.

Notes

- 1. Where requirements of the local codes, manufacturers' installation instructions, engineering documents, or regional ENERGY STAR programs overlap with the requirements of these guidelines, EPA offers the following guidance:
 - a. In cases where the overlapping requirements exceed the ENERGY STAR guidelines, these overlapping requirements shall be met;
 - b. In cases where overlapping requirements conflict with a requirement of these ENERGY STAR guidelines (e.g., slab insulation is prohibited to allow visual access for termite inspections), then the conflicting requirement within these guidelines shall not be met. Qualification shall only be allowed if the rater has determined that no equivalent option is available that could meet the intent of the conflicting requirement of these ENERGY STAR guidelines (e.g., switching from exterior to interior slab edge insulation).
- 2. The term "Rater" refers to the person completing the third-party inspections required for qualification. This party may be a certified Home Energy Rater, BOP Inspector, or an equivalent designation as determined by a Verification Oversight Organization such as RESNET.
- 3. A completed and signed Indoor airPLUS Verification Checklist may be submitted in lieu of the Water Management System checklists. Indoor airPLUS is a complimentary EPA label recognizing new homes equipped with a

DRAFT ENERGY STAR Qualified Homes, Version 3 Program Requirements for the State of California

These guidelines may only be used in the State of California

comprehensive set of Indoor Air Quality (IAQ) features. Indoor airPLUS verification can be completed by a Rater during the ENERGY STAR verification process. For more information, see www.epa.gov/indoorairplus

4. The average-size home with a specific number of bedrooms is termed the "Benchmark Home". The conditioned floor area of a Benchmark Home (CFA Benchmark Home) is determined by selecting the appropriate value from Exhibit 3. For homes with more than 8 bedrooms, the CFA Benchmark Home shall be determined by multiplying 600 sq. ft. times the total number of bedrooms and adding 400 sq. ft.

Example: CFA Benchmark Home for a 10 bedroom home = (600 sq. ft. x 10) + 400 sq. ft. = 6,400 sq. ft.

A bedroom is defined by RESNET as a room or space 70 sq. ft. or greater size, with egress window and closet, used or intended to be used for sleeping. A "den", "library", or "home office" with a closet, egress window, and 70 sq. ft. or greater size or other similar rooms shall count as a bedroom, but living rooms and foyers shall not.

An egress window, as defined in IRC section R310, shall refer to any operable window that provides for a means of escape and access for rescue in the event of an emergency. The egress window definition has been summarized for convenience. The egress window shall:

- have a sill height of not more than 44 inches above the floor; AND
- have a minimum net clear opening of 5.7 sq. ft.; AND
- · have a minimum net clear opening height of 24 in.; AND
- have a minimum net clear opening width of 20 in.; AND
- be operational from the inside of the room without the use of keys, tools or special knowledge
- 5. The conditioned floor area of a Benchmark Home (CFA Benchmark Home) is determined by selecting the appropriate value from Exhibit 2. For homes with more than 8 bedrooms, the CFA Benchmark Home shall be determined by multiplying 600 sq. ft. times the total number of bedrooms and adding 400 sq. ft. Example: CFA Benchmark Home for a 10 bedroom home = (600 sq. ft. x 10) + 400 sq. ft. = 6,400 sq. ft.

Version 3 - Effective 7/1/2011 Revised 12/16/2010 Page 3 of 3

ENERGY STAR Qualified Homes, Version 3 (Rev. 03) Inspection Checklists For National Program Requirements

As described in the ENERGY STAR Qualified Homes National Program Requirements, Version 3 (Rev. 03), one prerequisite for qualification is that a home must meet the requirements of the four attached checklists:

- Thermal Enclosure System Rater Checklist
- HVAC System Quality Installation Contractor Checklist
- HVAC System Quality Installation Rater Checklist
- Water Management System Builder Checklist (or Indoor airPLUS Verification Checklist)¹

To be eligible for qualification, a home must also meet the other requirements listed in the national program requirements document, including verification of all requirements by a Rater. Note that compliance with these guidelines is not intended to imply compliance with all local code requirements that may be applicable to the home to be built. Where requirements of the local codes, manufacturers' installation instructions, engineering documents, or regional ENERGY STAR programs overlap with the requirements of these guidelines, EPA offers the following guidance:

- a. In cases where the overlapping requirements exceed the ENERGY STAR guidelines, these overlapping requirements shall be met;
- b. In cases where overlapping requirements conflict with a requirement of these ENERGY STAR guidelines (e.g., slab insulation is prohibited to allow visual access for termite inspections), then the conflicting requirement within these guidelines shall not be met. Qualification shall only be allowed if the rater has determined that no equivalent option is available that could meet the intent of the conflicting requirement of these ENERGY STAR guidelines (e.g., switching from exterior to interior slab edge insulation).

The Rater must review all items on the Rater checklists. Raters are expected to use their experience and discretion to verify that the overall intent of each inspection checklist item has been met (i.e., identifying major defects that undermine the intent of the checklist item versus identifying minor defects that the Rater may deem acceptable). The column titled "N/A," which denotes items that are "not applicable," should be used when the checklist item is not present in the home or conflicts with local requirements.

In the event that a Rater finds an item that is inconsistent with the intent of the inspection checklists, the home cannot earn the ENERGY STAR until the item is corrected. If correction of the item is not possible, the home cannot earn the ENERGY STAR. In the event that an item on a Rater checklist cannot be inspected by the Rater, the home also cannot earn the ENERGY STAR. The only exceptions to this rule are in the Thermal Enclosure System Rater Checklist, where the builder may assume responsibility for verifying a maximum of eight items. This option shall only be used at the discretion of the Rater. When exercised, the builder's responsibility will be formally acknowledged by the builder signing off on the checklist for the item(s) that they verified.

In the event that a Rater is not able to determine whether an item is consistent with the intent (e.g., an alternative method of meeting a checklist requirement has been proposed), then the Rater shall consult their Provider. If the Provider also cannot make this determination, then the Rater or Provider shall report the issue to EPA prior to project completion at: energystarhomes@energystar.gov and will typically receive an initial response within 5 business days. If EPA believes the current program guidelines are sufficiently clear to determine whether the intent has been met, then this guidance will be provided to the Partner and enforced beginning with the house in question. In contrast, if EPA believes the program guidelines require revisions to make the intent clear, then this guidance will be provided to the Partner but only enforced for homes permitted after a specified transition period after the release of the revised guidelines, typically 60 days in length.

This process will allow EPA to make formal policy decisions as Partner questions arise and to disseminate these policy decisions through the periodic release of revised program documents to ensure consistent application of the program guidelines.

The Rater is required to keep electronic or hard copies of the completed and signed checklists The signature of the HVAC technician is required if any of the HVAC equipment specified on the HVAC System Quality Installation Contractor Checklist is installed in the home.

All checklists, including the HVAC System Quality Installation Contractor Checklist and Water Management System Builder Checklist may be completed for a batch of homes using a RESNET-approved sampling protocol to qualify homes as ENERGY STAR. For example, if the approved sampling protocol requires rating one in seven homes, then all of the checklists must be completed for the one required rating.

Rater Name:	Rater has verified that HVAC contractor holds credentials necessary to complete the HVAC System Quality Installation
Builder Company Name:	Contractor checklist
IVAC Company Name:	Rater has verified that builder is an ENERGY STAR Partner

ENERGY STAR Qualified Homes, Version 3 (Rev. 03) Inspection Checklist Notes

 A completed and signed Indoor airPLUS Verification Checklist may be submitted in lieu of the Water Management System Builder checklist. Indoor airPLUS is a complimentary EPA label recognizing new homes equipped with a comprehensive set of Indoor Air Quality (IAQ) features. Indoor airPLUS verification can be completed by a Rater during the ENERGY STAR verification process. For more information, see www.epa.gov/indoorairplus

2. The term "Rater" refers to the person completing the third-party inspections required for qualification. This party may be a certified Home Energy Rater, BOP Inspector, or an equivalent designation as determined by a Verification Oversight Organization such as RESNET.

Notes:

- 1. At the discretion of the Rater, the builder may verify up to eight items specified in this checklist. When exercised, the builder's responsibility will be formally acknowledged by the builder signing off on the checklist for the item(s) that they verified.
- 2. For Prescriptive Path: All windows, doors, and skylights shall meet or exceed ENERGY STAR Program Requirements for Residential Windows, Doors, and Skylights Version 5.0 as outlined at www.energystar.gov/windows. For Performance Path: All windows, doors and skylights shall meet or exceed the component U-factor and SHGC requirements specified in the 2009 IECC Table 402.1.1. If no NFRC rating is noted on the window or in product literature (e.g., for site-built fenestration), select the U-factor and SHGC value from tables 4 and 14, respectively, in 2005 ASHRAE Fundamentals, Chapter 31. Select the highest U-factor and SHGC value among the values listed for the known window characteristics (e.g., frame type, number of panes, glass color, and presence of low-e coating). Note that the U-factor requirement applies to all fenestration while the SHGC only applies to the glazed portion. The following exceptions apply:
 - a. An area-weighted average of fenestration products shall be permitted to satisfy the U-factor requirements;
 - An area-weighted average of fenestration products more than 50% glazed shall be permitted to satisfy the SHGC requirements;

- 15 square feet of glazed fenestration per dwelling unit shall be exempt from the U-factor and SHGC requirements, and shall be excluded from area-weighted averages calculated using a) and b), above;
- d. One side-hinged opaque door assembly up to 24 square feet in area shall be exempt from the U-factor requirements and shall be excluded from area-weighted averages calculated using a) and b), above;
- e. Fenestration utilized as part of a passive solar design shall be exempt from the U-factor and SHGC requirements, and shall be excluded from area-weighted averages calculated using a) and b), above. Exempt windows shall be facing within 45 degrees of true south and directly coupled to thermal storage mass that has a heat capacity > 20 btu/ft³x°F and provided in a ratio of at least 3 sq. ft per sq. ft. of south facing fenestration. Generally, thermal mass materials will be at least 2" thick.
- 3. Insulation levels in a home shall meet or exceed the component insulation requirements in the 2009 IECC Table 402.1.1. The following exceptions apply:
 - a. Steel-frame ceilings, walls, and floors shall meet the insulation requirements of the 2009 IECC Table 402.2.5. In CZ 1 and 2, the continuous insulation requirements in this table shall be permitted to be reduced to R-3 for steel-frame wall assemblies with studs spaced at 24" on center. This exception shall not apply if the alternative calculations in d) are used:
 - b. For ceilings with attic spaces, R-30 shall satisfy the requirement for R-38 and R-38 shall satisfy the requirement for R-49 wherever the full height of uncompressed insulation at the lower R-value extends over the wall top plate at the eaves. This exemption shall not apply if the alternative calculations in d) are used;
 - c. For ceilings without attic spaces, R-30 shall satisfy the requirement for any required value above R-30 if the design of the roof/ceiling assembly does not provide sufficient space for the required insulation value. This exemption shall be limited to 500 square ft. or 20% of the total insulated ceiling area, whichever is less. This exemption shall not apply if the alternative calculations in d) are used;
 - d. An alternative equivalent U-factor or total UA calculation may also be used to demonstrate compliance, as follows:

An assembly with a U-factor equal or less than specified in 2009 IECC Table 402.1.3 complies.

A total building thermal envelope UA that is less than or equal to the total UA resulting from the U-factors in Table 402.1.3 also complies. The insulation levels of all non-fenestration components (i.e., ceilings, walls, floors, and slabs) can be traded off using the UA approach under both the Prescriptive and the Performance path. Note that fenestration products (i.e., windows, skylights, doors) shall not be included in this calculation. Also, note that while ceiling and slab insulation can be included in trade-off calculations, the R-value must meet or exceed the minimum values listed in items 4.1 through 4.3 of the checklist to provide an effective thermal break, regardless of the UA tradeoffs calculated. The UA calculation shall be done using a method consistent with the AHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The calculation for a steel-frame envelope assembly shall use a series-parallel path calculation method.

- 4. Consistent with the 2009 IECC, slab edge insulation is only required for slab-on-grade floors with a floor surface less than 12 inches below grade. Slab insulation shall extend to the top of the slab to provide a complete thermal break. If the top edge of the insulation is installed between the exterior wall and the edge of the interior slab, it shall be permitted to be cut at a 45-degree angle away from the exterior wall.
- 5. Where an insulated wall separates a garage, patio, porch, or other unconditioned space from the conditioned space of the house, slab insulation shall also be installed at this interface to provide a thermal break between the conditioned and unconditioned slab. Post-tensioned slabs with integrated porch foundations are exempted from this requirement in all homes, as are post-tensioned slabs with integrated garage foundations in multi-family buildings, until feasible architectural details can be developed.
- 6. For purposes of this checklist, an air barrier is defined as any durable solid material that blocks air flow between conditioned space and unconditioned space, including necessary sealing to block excessive air flow at edges and seams and adequate support to resist positive and negative pressures without displacement or damage. EPA recommends, but does not require, rigid air barriers.

Open-cell or closed-cell foam shall have a finished thickness ≥ 5.5 " or 1.5", respectively, to qualify as an air barrier unless the manufacturer indicates otherwise.

If flexible air barriers such as house wrap are used, they shall be fully sealed at all seams and edges and supported using fasteners with caps or heads ≥ 1 " diameter unless otherwise indicated by the manufacturer. Flexible air barriers shall not be made of kraft paper, paper-based products, or other materials that are easily torn. If polyethylene is used, its thickness shall be > 6 mil.

- 7. Band joists are currently exempt from interior air barrier requirement in Climate Zones 4 thru 8, but highly encouraged by EPA as a best practice.
- 8. Up to 10% of the total exterior wall surface area is exempted from the reduced thermal bridging requirements to accommodate thermal fins, wing walls, masonry fireplaces or similar architectural details.

- 9. Examples of supports necessary for permanent contact include staves for batt insulation or netting for blown-in insulation. Batts that completely fill a cavity enclosed on all six sides may be used to meet this requirement without the need for supports, even though some compression will occur due to the excess insulation, as long as the compressed value meets or exceeds the required insulation level. Specifically, the following batts may be used in six-sided floor cavities: R-19 batts in 2x6 cavities, R-30 batts in 2x8 cavities, R-38 batts in 2x10 cavities, and R-49 batts in 2x12 cavities. For example, in a home that requires R-19 floor insulation, an R-30 batt may be used in a six-sided 2x8 floor cavity.
- 10. Fully-aligned air barriers may be installed at the exterior surface of the floor cavity in all Climate Zones if the insulation is installed in contact with this exterior air barrier and the perimeter rim and band joists of the floor cavity are also sealed and insulated to comply with the fully-aligned air barrier requirements for walls.
- 11. Sloped attics shall meet the air barrier requirements for walls and are defined as sloped surfaces separating conditioned attics from ambient conditions. In contrast, sloped ceilings shall meet the air barrier requirements for ceilings and are defined as sloped surfaces separating conditioned house space from ambient conditions (e.g., sloped ceiling at the perimeter of a bedroom).
- 12. The minimum designated R-values must be achieved regardless of the trade-offs determined using an equivalent U-factor or UA alternative calculation. Note that if the minimum designated values are used, they must be compensated with higher values elsewhere using an equivalent U-factor or UA alternative calculation in order to meet the overall insulation requirements of the 2009 IECC. Also, note that these requirements can be met by using any available strategy, such as a raised-heel truss, alternate framing that provides adequate space, and/or high-density insulation. In climate zones one through three, one option that will work for most homes is to use 2x6 framing, an R-21 high-density batt, and a wind baffle that only requires 0.5" of clearance.
- 13. Insulated sheathing rated for water protection can be used as a water resistant barrier if all seams are taped and sealed. If the insulated sheathing is not rated for water protection, it shall be attached directly over a water-resistive barrier and sheathing. In addition, it shall provide the required R-value as demonstrated through either testing in accordance with ASTM C 1363 or by attaining the required R-value at its minimum thickness. If non-insulated structural sheathing is used at corners, advanced framing details listed under requirement 4.4.5 shall be met for those wall sections. Rigid insulation, if used, may be installed on either the interior or exterior side of the wall.
- 14. Steel framing shall meet the reduced thermal bridging requirements by complying with item 4.4.1 of the checklist.
- 15. Double-wall framing is defined as any framing method that ensures a continuous layer of insulation covering the studs to at least the R-value required in Section 4.4.1 of the checklist, such as offset double-stud walls, aligned double-stud walls with continuous insulation between the adjacent stud faces, or single-stud walls with 2x2 or 2x3 cross-framing. In all cases, insulation shall fill the entire wall cavity from the interior to exterior sheathing except at windows, doors and other penetrations.
- 16. All exterior corners shall be constructed to allow access for the installation of ≥ R-6 insulation that extends to the exterior wall sheathing. Examples of compliance options include standard-density insulation with alternative framing techniques, such as using three studs per corner, or high-density insulation (e.g., spray foam) with standard framing techniques.
- 17. Headers shall be minimum R-3 for Climate Zones 1 through 4 and R-5 for Climate Zones 5 through 8 using continuous rigid insulation sheathing, SIP headers, other prefabricated insulated headers, single-member or two-member headers with insulation either in between or on one side, or an equivalent assembly, except where a framing plan provided by the builder, architect, designer, or engineer indicates that full-depth solid headers are the only acceptable option. The rater need not evaluate the structural necessity of the details in the framing plan to qualify the home. Also, the framing plan need only encompass the details in question and not necessarily the entire home. R-value requirement refers to manufacturer's nominal insulation value.
- 18. Framing at windows shall be limited to a maximum of one pair of king studs and one pair jack studs per window opening to support the header and window sill. Additional jack studs shall be used only as needed for structural support and cripple studs only as needed to maintain on-center spacing of studs.
- 19. Insulation shall run behind interior/exterior wall intersections using ladder blocking, full length 2"x6" or 1"x6" furring behind the first partition stud, drywall clips, or other equivalent alternative.
- 20. Vertical framing members shall either be on-center or have an alternative structural purpose (e.g., framing members at the edge of pre-fabricated panels) that is apparent to the rater or documented in a framing plan provided by the builder, architect, designer, or engineer. The rater need not evaluate the structural necessity of the details in the framing plan to qualify the home. Also, the framing plan need only encompass the details in question and not necessarily the entire home. No more than 5% of studs may lack an apparent or documented structural purpose, which is equivalent to one vertical stud for every 30 linear feet of wall, assuming 16" o.c. stud spacing.
- 21. Light tubes that do not include a gasketed lens are required to be sealed and insulated ≥ R-6 for the length of the tube.
- 22. In Climate Zones 1 through 3, stucco over rigid insulation tightly sealed to windows and doors shall be considered equivalent to sealing rough openings with caulk or foam.
- 23. Examples of durable covers include, but are not limited to, pre-fabricated covers with integral insulation, rigid foam adhered to cover with adhesive, or batt insulation mechanically fastened to the cover (e.g., using bolts, metal wire, or metal strapping).

1. The HVAC System Quality Installation Contractor Checklist is designed to align with the requirements of ASHRAE 62.2-2010 and published addenda and ANSI / ACCA's 5 QI-2007 protocol, thereby improving the performance of HVAC equipment in new homes when compared to homes built to minimum code. However, these features alone cannot prevent all ventilation, indoor air quality, or HVAC problems (e.g., those caused by a lack of maintenance by occupants). Therefore, this checklist is not a guarantee of proper ventilation, indoor air quality, or HVAC performance.

This checklist applies to ventilation systems, split air conditioners, unitary air conditioners, air-source/water-source (i.e., geothermal) heat pumps up to 65,000 Btu/h and furnaces up to 225,000 Btu/h. All other equipment, including boilers, is exempt.

This checklist shall be provided by the Rater to the HVAC contractor who shall complete one checklist for each system. Upon completion, the HVAC contractor shall return the checklist(s) to the Rater. Alternatively, at the discretion of the contractor and Rater, the Rater may verify any item on this checklist in place of the contractor. When this occurs, the Rater shall check the box of the verified items in the Rater Verified column. The Rater is only responsible for ensuring that the Contractor has completed the Contractor checklist in its entirety and for the items that are checked in the Rater Verified column (if any). The Rater is not responsible for assessing the accuracy of the items in this checklist that are not checked in the Rater Verified column. Instead, it is the contractor's exclusive responsibility to ensure the design and installation comply with the Contractor checklist.

This checklist with supporting documents may also be used to demonstrate compliance with Indoor airPLUS specifications 4.1, 4.2, 4.5, 4.6, and 7.1.

- 2. Description of HVAC system location or area served (e.g., "whole-house", "upper level", "lower-level", or "supplemental for excess loads.").
- 3. Check "Yes" if this system is to handle temporary occupant loads. Such a system may be required to accommodate a significant number of guests on a regular or sporadic basis and shall be handled by a supplemental cooling system (e.g., a small, single-package unit or split-coil unit) or by a system that can shift capacity from zone to zone (e.g., a variable volume system).
- 4. The person responsible for the heating, cooling, and ventilation design, whether it be the HVAC technician or other qualified HVAC design professional, shall be responsible for completing sections 1 and 2 of this checklist.
- 5. The 'Cont. / Tech. Verified' column shall be used to indicate items verified by the HVAC Contractor or Technician. The 'Rater Verified' column shall only be used to indicate items verified by the Rater, for homes in which the Rater has agreed to verify and accept responsibility for one or more requirements.
- 6. For proper procedures, exceptions, and selection methods see ASHRAE 62.2-2010 and published addenda. All components shall be designed and installed per local codes, manufacturers' installation instructions, engineering documents, and regional ENERGY STAR program requirements.
 - The system shall have at least one supply or exhaust fan with associated ducts and controls. Local exhaust fans are allowed to be part of an exhaust ventilation system. Outdoor air ducts connected to the return side of an air handler are allowed to be part of a supply ventilation system if manufacturers' requirements for return air temperature are met.
- 7. Heating and cooling loads shall be calculated, equipment capacity shall be selected, and duct systems shall be sized according to the latest editions of ACCA Manuals J, S, & D, respectively, ASHRAE 2009 Handbook of Fundamentals, or a substantively equivalent procedure.
- 8. If the design conditions are dictated by a code or regulation, then the requirements of the lawful or controlling authority supersedes the Manual J or ASHRAE default design values. Otherwise, the default values shall be used. The values for the geographically closest location shall be selected or a justification provided for the selected location.
- 9. The number of occupants among all HVAC systems in the home must be equal to the number of bedrooms, as defined below, plus one. Occupants listed for systems that are indicated in the header as a cooling system for temporary occupant loads, as described in footnote 3, shall be permitted to exceed this limit.

A bedroom is defined by RESNET as a room or space 70 sq. ft. or greater size, with egress window and closet, used or intended to be used for sleeping. A "den", "library", or "home office" with a closet, egress window, and 70 sq. ft. or greater size or other similar rooms shall count as a bedroom, but living rooms and foyers shall not.

An egress window, as defined in IRC section R310, shall refer to any operable window that provides for a means of escape and access for rescue in the event of an emergency. The egress window definition has been summarized for convenience. The egress window shall:

have a sill height of not more than 44 inches above the floor; AND

- have a minimum net clear opening of 5.7 sq. ft.; AND
- have a minimum net clear opening height of 24 in.; AND
- have a minimum net clear opening width of 20 in.; AND
- be operational from the inside of the room without the use of keys, tools or special knowledge
- 10. "Predominant" is defined as the SHGC value used in the greatest amount of window area in the home
- 11. Infiltration rate shall reflect value used in confirmed or projected HERS rating for rated home. Alternatively, use "Average" or "Semi-loose" values for the cooling season infiltration rates and "Semi-tight" or "Average" values for the heating season infiltration rates, as defined by ACCA Manual J, Eighth Edition, Version Two.
- 12. Design airflow is the design value(s) for the blower in CFM, as determined by using the manufacturer's expanded performance data to select equipment, per ACCA Manual S procedures.
- 13. Design duct static pressure shall account for the installation of a MERV6 or higher filter.
- 14. All evaporators and condensing units shall be properly matched as demonstrated by an attached AHRI certificate. If an AHRI certificate is not available, a copy of OEM-provided catalog data indicating acceptable combination selection and performance data shall be attached.
- 15. If whole-house ventilation system utilizes the HVAC air handler, then the fan speed type shall be ECM/ICM, variable speed, and run at a reduced speed during ventilation, or include a controller (e.g., smart cycler) that reduces the ventilation run time by accounting for hours when HVAC system is heating or cooling the home.
- 16. Listed system capacity at design conditions is to be obtained from the OEM expanded performance data.
- 17. For cooling systems, the next largest nominal piece of equipment may be used that is available to satisfy the latent and sensible requirements. Single-speed systems generally have OEM nominal size increments of ½ ton. Multispeed or multi-stage equipment may have OEM nominal size increments of one ton. Therefore, the use of these advanced system types can provide extra flexibility to meet the equipment sizing requirements.
- 18. Contractors shall perform a load calculation for the specific house plan and orientation of the home to be qualified or, for plans with multiple options or that may be built in more than one orientation, for every option and orientation. If the loads are calculated for multiple orientations and the loads across all orientations vary by ≤ 25%, then the largest load shall be permitted to be used for equipment selection for all orientations, subject to the over-sizing limits of ACCA Manual S. Otherwise, the contractor shall group the load for each orientation into a set with ≤ 25% variation and equipment selection shall be completed for each set of loads. All other aspects of system design (e.g., duct static pressure, design airflow) shall be completed for the specific orientation and configuration of the home. Note that room-level design airflows determined using Manual J and Manual S may be different than the design values used for a standardized Manual D duct design for each option and orientation. Duct balancing shall be performed to meet the design airflows for each orientation and option.
- 19. For warm air heating systems, the output capacity must be between 100% and 140% of calculated system load unless a larger size is dictated by the cooling equipment selection.
- 20. Either factory-installed or field-installed TXV's may be used. For field-installed TXV's, ensure that sensing bulbs are insulated and tightly clamped to the vapor line with good linear thermal contact at the recommended orientation, usually 4 or 8 o'clock.
- 21. Examples of return or supply duct static pressure measurement locations are: plenum, cabinet, trunk duct, as well as front, back, left or right side. Test hole locations shall be well marked and accessible.
- 22. The pressure matching method uses a calibrated fan to match the supply plenum pressure produced when the HVAC air handler fan is in operation. The airflow through the calibrated fan that produces the same pressure is assumed to match the HVAC air handler fan airflow.
- 23. Ducts shall not include coiled or looped ductwork except to the extent needed for acoustical control. Balancing dampers or proper duct sizing shall be used instead of loops to limit flow to diffusers. When balancing dampers are used, they shall be located at the trunk to limit noise unless the trunk will not be accessible when the balancing process is conducted. In such cases, opposable blade dampers or dampers located in the duct boot are permitted.
- 24. Condensate pan shall be made of corrosion-resistant materials, to include galvanized steel and plastic. Drain pan shall drain condensate to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drainage system; and shall be equipped with a backflow prevention valve when drained to a shared drainage system, such as a storm water management system.
- 25. HVAC technician signature required prior to submittal to Rater. If the HVAC system design (Sec. 1 & 2) was not completed by the HVAC technician, then the designer shall sign in addition to HVAC technician.

Inspection Guidelines	Must Correct	Rater Verified	N/A	
1. Review of HVAC System Quality Installation Contractor Checklist ²				
1.1 HVAC System Quality Installation Contractor checklist completed in its entirety and collected for records, along with documentation on ventilation system (1.3), full load calculations (2.18), AHRI certificate (3.15), and balancing report (10.2).				
1.2 Review the following parameters related to system cooling design, selection, and installation from the (Contractor checklist item # indicated in parenthesis):	e HVAC Co	ntractor che	ecklist	
1.2.1 Outdoor design temperatures (2.4) are equal to the 1% and 99% ACCA Manual J design temperatures for contractor-designated design location ³				
1.2.2 Home orientation (2.5) matches orientation of rated home				
1.2.3 Number of Occupants (2.6) equals number of occupants in rated home 4				
1.2.4 Conditioned floor area (2.7) is within ±10% of conditioned floor area of rated home				
1.2.5 Window area (2.8) is within ±10% of calculated window area of rated home				
1.2.6 Predominant window SHGC (2.9) is within 0.1 of predominant value in rated home ⁵				
1.2.7 Listed latent cooling capacity (3.10) exceeds design latent heat gain (2.12)				
1.2.8 Listed sensible cooling capacity (3.11) exceeds design sensible heat gain (2.13)				
1.2.9 Listed total cooling capacity (3.12) is 95-115% (or 95-125% for Heat Pumps in Climate Zones 4-8) of design total heat gain (2.14), or next nominal size ⁶				
1.2.10 HVAC manufacturer and model numbers on installed equipment, contractor checklist (3.1, 3.3, 5.1), and AHRI certificate or OEM catalog data all match ⁷				
1.2.11 Using reported liquid line (6.3) or suction line (6.5) pressure, corresponding temp. (as determined using pressure/temperature chart for refrigerant type) matches reported condenser (7.1) or evaporator (7.5) saturation temperature (+/- 3 degrees) 8				
1.2.12 Calculated subcooling (7.1 minus 6.4) or superheat (6.6 minus 7.5) value equals reported target subcooling (7.3) or superheat (7.7) temperature ⁸				
1.3 Rater-verified supply & return duct static pressure <110% of contractor values (9.3, 9.4)				
2. Duct Quality Installation - Applies to All Heating, Cooling, Ventilation, Exhaust, and Pressure Balan	cing Ducts			
2.1 Connections and routing of ductwork completed without kinks or sharp bends. ⁹				
2.2 No excessive coiled or looped flexible ductwork. 10				
2.3 Flexible ducts in unconditioned space not installed in cavities smaller than outer duct diameter; in conditioned space not installed in cavities smaller than inner duct diameter				
2.4 Flexible ducts supported at intervals as recommended by mfr. but at a distance ≤ 5 ft.				
2.5 Building cavities not used as supply or return ducts unless they meet items 3.2, 3.3, 4.1, and 4.2 of this checklist.				
2.6 HVAC ducts, cavities used as ducts, and combustion inlets and outlets may pass perpendicularly through exterior walls but shall not be run within exterior walls unless at least R-6 continuous insulation is provided on exterior side of the cavity, along with an interior and exterior air barrier where required by the Thermal Enclosure System Rater Checklist.				
2.7 Quantity & location of supply and return duct terminals match contractor balancing report.				
2.8 Bedrooms pressure-balanced using any combination of transfer grills, jump ducts, dedicated return ducts, and/or undercut doors to either: a) provide 1 sq. in. of free area opening per 1 CFM of supply air, as reported on the contractor-provided balancing report; or b) achieve a Rater-measured pressure differential ≤ 3 Pa (0.012 in. w.c.) with respect to the main body of the house when bedroom doors are closed and the air handler is operating. ¹¹				
3. Duct Insulation - Applies to All Heating, Cooling, Supply Ventilation, and Pressure Balancing Ducts 1				
3.1 All connections to trunk ducts in unconditioned space are insulated.				
3.2 Prescriptive Path: Supply ducts in unconditioned attic have insulation ≥ R-8. Performance Path: Supply ducts in unconditioned attic have insulation ≥ R-6.				
3.3 All other supply ducts and all return ducts in unconditioned space have insulation ≥ R-6.				
4. Duct Leakage - Applies to All Heating, Cooling, and Balanced Ventilation Ducts				
4.1 Total Rater-measured duct leakage ≤ 6 CFM25 per 100 sq. ft. of conditioned floor area ^{13,14}				
4.2 Rater -measured duct leakage to outdoors ≤ 4 CFM25 per 100 sq. ft. of conditioned floor area. 13, 14, 15				
4.3 Duct boots sealed to floor, wall, or ceiling using caulk, foam, mastic tape, or mastic paste.

Rater Name:	Date Checkli	st Inspected:			
Rater Signature:		any Name:			

- 1. The HVAC System Quality Installation Rater Checklist is designed to align with the requirements of ASHRAE 62.2-2010 and published addenda and ANSI / ACCA's 5 QI-2007 protocol, thereby improving the performance of HVAC equipment in new homes when compared to homes built to minimum code. However, these features alone cannot prevent all ventilation, indoor air quality, and HVAC problems, for instance those caused by a lack of occupant maintenance. Therefore, this checklist is not a guarantee of proper ventilation, indoor air quality, or HVAC performance. This checklist with supporting documents may also be used to demonstrate compliance with Indoor airPLUS specifications 4.1, 4.2, 4.5, 4.6, and 7.1.
- 2. The Rater is only responsible for ensuring that the Contractor has completed the Contractor checklist in its entirety and verifying the discrete objective parameters referenced in Section 1 of this checklist, not for assessing the accuracy of the load calculations or field verifications included or to verify the accuracy of every input on the Contractor checklist.
- 3. The Rater shall either confirm that the contractor selected the geographically closest available location or collect from the contractor a justification for the selected location. The Rater need not evaluate the legitimacy of the justification to qualify the home.
- 4. The number of occupants among all HVAC systems in the home shall be equal to the number of RESNET-defined bedrooms plus one. Occupants listed for systems for which the header of the contractor checklist indicates that it is designed to handle temporary occupant loads, as defined in footnote 3 of the HVAC System Quality Installation Contractor Checklist, shall be permitted to exceed this limit.
- 5. "Predominant" is defined as the SHGC value used in the greatest amount of window area in the home.
- 6. For cooling systems, the next largest nominal piece of equipment may be used that is available to satisfy the latent and sensible requirements. Single-speed systems generally have OEM nominal size increments of ½ ton. Multi-speed or multi-stage equipment may have OEM nominal size increments of one ton. Therefore, the use of these advanced system types can provide extra flexibility to meet the equipment sizing requirements.
- 7. In cases where the condenser unit is installed after the time of inspection by the Rater, the HVAC manufacturer and model numbers on installed equipment can be documented through the use of photographs provided by the HVAC Contractor after installation is complete.
- 8. If contractor has indicated that an OEM test procedure has been used in place of a sub-cooling or super-heat process and documentation has been attached that defines this procedure, then the box for "n/a" shall be checked for this item.
- 9. Kinks are to be avoided and are caused when ducts are bent across sharp corners such as framing members. Sharp bends are to be avoided and occur when the radius of the turn in the duct is less than one duct diameter.
- 10. Ducts shall not include coiled or looped ductwork except to the extent needed for acoustical control. Balancing dampers or proper duct sizing shall be used instead of loops to limit flow to diffusers. When balancing dampers are used, they shall be located at the trunk to limit noise unless the trunk will not be accessible when the balancing process is conducted. In such cases, Opposable Blade Dampers (OBD) or dampers that are located in the duct boot are permitted.
- 11. For HVAC system with multi-speed fans, the highest design fan speed shall be used when verifying this requirement.
- 12. EPA recommends, but does not require, that all metal ductwork (e.g., exhaust ducts, duct boots) be insulated and that insulation be sealed to duct boots to prevent condensation.
- 13. Duct leakage shall be determined and documented by a Rater using a RESNET-approved testing protocol only after all components of the system have been installed (e.g., air handler and register grilles). Leakage limits shall be assessed on a persystem, rather than per-home, basis. Testing of duct leakage to the outside can be waived if all ducts & air handling equipment are located within the home's air and thermal barriers AND envelope leakage has been tested to be less than or equal to half of the Prescriptive Path infiltration limit for the Climate Zone where the home is to be built.
- 14. For all homes that have less than 1,200 sq ft of conditioned floor area (CFA), total measured duct leakage shall be ≤ 8 CFM25 per 100 sq. ft. of CFA and measured duct leakage to outdoors shall be ≤ 5 CFM25 per 100 sq. ft. of CFA.
- 15. If total duct leakage is ≤ 4 CFM25 per 100 sq. ft. of conditioned floor area, or ≤ 5 CFM25 per 100 sq. ft. of conditioned floor area for homes that have less than 1,200 sq. ft. of conditioned floor area, then leakage to outdoors need not be tested.
- 16. The whole-house ventilation air flow and local exhaust air flows shall be measured by the Rater using a flow hood, flow grid, anemometer (in accordance with AABC, NEBB or ASHRAE procedures), or substantially equivalent method.
- 17. In cases where the condenser unit is installed after the time of inspection by the Rater, the Rater is exempt from verifying item 6.2 when the condenser is for an AC unit and also item 6.3 when the condenser is for a heatpump unit.
- 18. The outlet and inlet of balanced ventilation systems shall meet these spacing requirements unless manufacturer instructions indicate that a smaller distance may be used. However, if this occurs the manufacturer's instructions shall be collected for documentation purposes.
- 19. Without proper maintenance, ventilation air inlet screens often become filled with debris. Therefore, EPA recommends, but does not require, that these ventilation air inlets be located so as to facilitate access and regular service by the owner.
- 20. Per ASHRAE 62.2-2010, an exhaust system is one or more fans that remove air from the building, causing outdoor air to enter by ventilation inlets or normal leakage paths through the building envelope. Examples include bath exhaust fans, range hoods, and clothes dryers

- 21. Per ASHRAE 62.2-2010, a bathroom is any room containing a bathtub, shower, spa, or similar source of moisture.
- 22. An intermittent mechanical exhaust system, where provided, shall be designed to operate as needed by the occupant. Control devices shall not impede occupant control in intermittent systems.
- 23. Kitchen volume shall be determined by drawing the smallest possible rectangle on the floor plan that encompasses all cabinets, pantries, islands, and peninsulas and multiplying by the average ceiling height for this area. Cabinet volume shall be included in the kitchen volume calculation.
- 24. If the flow rate of the selected exhaust fan is less than 5 ACH, based on kitchen volume, then a vented range hood or appliance-range hood combination is required rather than a remote fan that is not integral to the range. Also, for intermittent kitchen exhaust fans that are integrated with microwaves, a rated air flow rate that is ≥ 200 CFM may be used in lieu of measuring the actual air flow rate.
- 25. Exhaust outlets from more than one dwelling unit may be served by a single exhaust fan if the fan runs continuously or if each outlet has a back-draft damper to prevent cross-contamination when the fan is not running.
- 26. Fans exempted from this requirement include HVAC air handlers and remote-mounted fans (i.e., fans outside habitable spaces, bathrooms, toilets, and hallways and with ≥ 4 ft. ductwork between fan and intake grills). Per ASHRAE 62.2-2010, habitable spaces are intended for continual human occupancy; such space generally includes areas used for living, sleeping, dining, and cooking but does not generally include bathrooms, toilets, hallways, storage areas, closets, or utility rooms.
- 27. Per the 2009 International Mechanical Code, a direct-vent appliance is one that is constructed and installed so that all air for combustion is derived from the outdoor atmosphere and all flue gases are discharged to the outside atmosphere. Furthermore, a mechanical draft system is a venting system designed to remove flue or vent gases by mechanical means consisting of an induced draft portion under non-positive static pressure or a forced draft portion under positive static pressure.
- 28. The pressure boundary is the primary air enclosure boundary separating indoor and outdoor air. For example, a volume that has more leakage to outside than to conditioned space would be outside the pressure boundary.
- 29. Raters shall use either the Building Performance Institute's (BPI's) Combustion Safety Test Procedure for Vented Appliances or RESNET's Interim Guidelines for Combustion Appliance Testing and Writing Work Scope and be BPI-certified or RESNET-accredited to follow the protocol.
- 30. Per ASHRAE 62.2-2010 and pub. addenda, the term "net-exhaust flow" is defined as flow through an exhaust system minus the compensating outdoor airflow through any supply system that is interlocked to the exhaust system. "Net supply flow" is intended to represent the inverse. If net exhaust flow exceeds allowable limit, it shall be reduced or compensating outdoor airflow provided.
- 31. Per ASHRAE 62.2-2010, occupiable space is any enclosed space inside the pressure boundary and intended for human activities, including, but not limited to, all habitable spaces, toilets, closets, halls, storage and utility areas, and laundry areas. See footnote 26 for definition of "habitable spaces".
- 32. The minimum volume of combustion air required for safe operation by the manufacturer and/or code shall be met or exceeded. Also, in accordance with the National Fuel Gas Code, ANSI Z223.I/NFPA54, unvented room heaters shall not be installed in bathrooms or bedrooms.
- 33. Per ASHRAE 62.2-2010, ducted mechanical systems are those that supply air to an occupiable space through ductwork exceeding 10 ft in length and through a thermal conditioning component, except for evaporative coolers. Systems that do not meet this definition are exempt from this requirement. Also, mini-split systems typically do not have MERV-rated filters available for use and are, therefore, also exempted under this version of the guidelines.
- 34. HVAC filters located in the attic shall be considered accessible to the owner if drop-down stairs provide access to attic and a permanently installed walkway has been provided between the attic access location and the filter.
- 35. The filter media box (i.e., the component in the HVAC system that houses the filter) may be either site-fabricated by the installer or pre-fabricated by the manufacturer to meet this requirement. These requirements only apply when the filter is installed in a filter media box located in the HVAC system, not when the filter is installed flush with the return grill.

ENERGY STAR Qualified Homes, Version 3 (Rev. 03) Water Management System Builder Checklist^{1,2,3}

ne Address: City: State:				
Inspection Guidelines	Must Correct	Builder Verified	Rater Verified	N/A
1. Water-Managed Site and Foundation				
1.1 Patio slabs, porch slabs, walks, and driveways sloped > 0.25 in. per ft. away from home to edge of surface or 10 ft., whichever is less.4				
1.2 Final grade is, or is scheduled by builder to be, sloped ≥ 0.5 in. per ft. away from home for ≥ 10 ft. and back-fill tamped to prevent settling ⁴				
1.3 Capillary break beneath all slabs (e.g., slab on grade, basement slab) except crawlspace slabs using either: ⁵				
1.3.1 4 in. bed of ≥ 0.5 in. clean aggregate covered with ≥ 6 mil polytethylene sheeting lapped 6-12 in. or ≥ 1" extruded polystyrene insulation with taped joints, in direct contact with concrete slab above, OR;				
1.3.2 4 in. uniform layer of sand overlaid with geotextile drainage matting and covered with sheeting or ≥ 1" extruded polystyrene insulation with taped joints.				
1.4 Capillary break for all crawlspace floors using either: ⁵				
1.4.1 Concrete slab over <a>6 mil polyethylene sheeting, lapped 6-12 in., OR ;				
1.4.2 ≥ 6 mil polyethylene sheeting, lapped 6-12 in. and either a) lapped up each wall or pier far enough to be fastened with furring strips or equivalent, or b) secured in the ground at the perimeter using stakes.				
 1.5 Exterior surface of below-grade walls finished as follows: For poured concrete, concrete masonry, and insulated concrete forms, finish with damp-proofing coating For wood framed walls, finish with polyethylene and adhesive or other equivalent waterproofing 				
1.6 Class 1 vapor retarders not installed on the interior side of air permeable insulation in exterior below-grade walls ⁶				
1.7 Sump pump covers mechanically attached with full gasket seal or equivalent				
1.8 Drain tile surrounded with clean gravel and fabric filter ⁷				
2. Water-Managed Wall Assembly				
2.1 Flashing at bottom of exterior walls with weep holes included for masonry veneer and weep screed for stucco cladding systems, or equivalent drainage system				
2.2 Fully sealed continuous drainage plane behind exterior cladding that laps over flashing in Section 2.1. Additional bond-break drainage plane layer provided behind all stucco and non- structural masonry cladding wall assemblies ⁸				
2.3 Window and door openings fully flashed ⁹				
3. Water-Managed Roof Assembly				
3.1 Step and kick-out flashing at all roof-wall intersections, extending ≥ 4" on wall surface above roof deck and integrated with drainage plane above ¹⁰				
3.2 For homes that don't have a slab-on-grade foundation and do have expansive or collapsible soils, gutters & downspouts provided that empty to lateral piping that deposits water on sloping final grade ≥ 5 ft. from foundation or to underground catchment system ≥ 10 ft. from foundation. ¹¹				
3.3 Self-sealing bituminous membrane or equivalent at all valleys & roof deck penetrations 12				
3.4 In 2009 IECC Climate Zones 5 and higher, self-sealing bituminous membrane or equivalent over sheathing at eaves from the edge of the roof line to > 2 ft. up roof deck from the interior plane of the exterior wall. ¹²				
4. Water-Managed Building Materials				
4.1 Wall-to-wall carpet <u>not</u> installed within 2.5 feet of toilets, tubs, and showers				
4.2 Cement board or equivalent moisture-resistant backing material installed on all walls behind tub and shower enclosures composed of tile or panel assemblies with caulked joints. Paper-faced backerboard shall not be used ¹³				
4.3 In Warm-Humid climates, Class 1 vapor retarders not installed on the interior side of air permeable insulation in above-grade walls, except at shower and tub walls ⁶				
4.4 Building materials with visible signs of water damage or mold <u>not</u> installed 14				
4.5 Interior walls <u>not</u> enclosed (e.g., with drywall) if either the framing members or insulation products have high moisture content ¹⁵

Rater Signature: Date:				

ENERGY STAR Qualified Homes, Version 3 (Rev. 03) Water Management System Builder Checklist^{1,2,3}

- 1. The specifications in this checklist are designed to help improve moisture control in new homes compared with homes built to minimum code. However, these features alone cannot prevent all moisture problems. For example, leaky pipes or overflowing sinks or baths can lead to moisture issues and negatively impact the performance of this checklist's specified features.
- 2. This checklist shall be provided by the Rater to the Builder who shall complete the checklist. Upon completion, the Builder shall return the checklist to the Rater for review. If desired by the Builder, the Rater may verify any item on this checklist. When this occurs, the Rater shall check the box of the verified items in the Rater Verified column. The Rater is only responsible for ensuring that the Builder has completed the Builder checklist in its entirety and for the items that are checked in the Rater Verified column (if any). The Rater is not responsible for assessing the accuracy of the field verifications for items in this checklist that are not checked in the Rater Verified column. Instead, it is the builder's exclusive responsibility to ensure the design and installation comply with the Builder checklist.
- A completed and signed Indoor airPLUS Verification Checklist may be submitted in lieu of the Water Management System Builder checklist. For more information, see www.epa.gov/indoorairplus
- 4. Where setbacks limit space to less than 10 ft., swales or drains designed to carry water from foundation shall be provided. Backfill tamping is not required if proper drainage can be achieved using non-settling compact soils, as determined by a certified hydrologist, soil scientist, or engineer.
- 5. Polyethylene sheeting is not required in Dry (B) climates as shown in 2009 IECC Figure 301.1 and Table 301.1, except in U.S. EPA Zone 1 Radon areas. Polyethylene sheeting is also not required for raised pier foundations with no walls. In areas with free-draining soils, identified as Group 1 in the IRC by a certified hydrologist, soil scientist, or engineer through a site visit, a gravel layer or geotextile matting is not required. EPA recommends, but does not require, radon-resistant features for homes built in EPA Radon Zones 1, 2 and 3. For more information, see www.epa.gov/indoorairplus
- 6. The 2009 IRC defines Class I vapor retarders as a material or assembly with a rating of ≤ 0.1 perm, as defined using the desiccant method with Procedure A of ASTM E 96. The following materials are typically rated at ≤ 0.1 perm and therefore shall not be used on the interior side of air permeable insulation in above-grade exterior walls in warmhumid climates or below-grade exterior walls in any climate: rubber membranes, polyethylene film, glass, aluminum foil, sheet metal, foil-faced insulating sheathings, and foil-faced non-insulating sheathings. These materials can be used on the interior side of walls if air permeable insulation is not present (e.g., foil-faced extruded polystyrene rigid insulation board adjacent to a below-grade concrete foundation wall is permitted).

Note that this list is not comprehensive and other materials with a perm rating ≤ 0.1 also shall not be used. Also, if manufacturer specifications for a specific product indicate a perm rating above 0.1, then the material may be used, even if it is in this list. Also note that open-cell and closed-cell foam generally have perm ratings above this limit and may be used unless manufacturer specifications indicate a perm rating < 0.1.

Several exemptions to these requirements apply:

- Class I vapor retarders, such as ceramic tile, may be used at shower and tub walls;
- Class I vapor retarders, such as mirrors, may be used if they are mounted with clips or other spacers that allow air to circulate behind them.
- 7. Protected drain tile shall be installed at the footings of basement and crawlspace walls, level or sloped to discharge to outside grade (daylight) or to a sump pump. The top of each drain tile pipe shall always be below the bottom of the concrete slab or crawlspace floor. Each pipe shall be surrounded with at least 6 inches of ½ to ¾ inch washed or clean gravel. The gravel layer shall be fully wrapped with fabric cloth or drain tile pre-wrapped with a fabric filter to prevent clogging of the drain tile with sediment.
- 8. Any of the following systems may be used: a monolithic weather-resistant barrier (i.e., house wrap) sealed or taped at all joints; weather resistant sheathings (e.g., faced rigid insulation) fully taped at all "butt" joints; lapped shingle-style building paper or felts; or other water-resistive barrier recognized by ICC-ES or other accredited agency.
- Include pan flashing at sills, side flashing that extends over pan flashing, and top flashing that extends over side flashing.
- 10. Intersecting wall siding shall terminate 1 in. above the roof or higher, per manufacturer's recommendations. Continuous flashing shall be installed in place of step flashing for metal and rubber membrane roofs.
- 11. The assessment of whether the soil is expansive or collapsible shall be completed by a certified hydrologist, soil scientist, or engineer. Gutters shall be not required in dry climates as shown in 2009 IECC Figure 301.1 and Table 301.1. A roof design without gutters is also acceptable if it deposits rainwater to a grade-level rock bed with a waterproof liner and a drain pipe that deposits water on a sloping finish grade ≥ 5 ft. from foundation. Rainwater

ENERGY STAR Qualified Homes, Version 3 (Rev. 03) Water Management System Builder Checklist^{1,2,3}

harvesting systems may also be used to meet this requirement when designed to properly drain overflow, meeting the discharge-distance requirements above.

- 12. Not required in dry climates as shown in 2009 IECC Figure 301.1 and Table 301.1.
- 13. Monolithic tub and shower enclosures (e.g., fiberglass with no seams) are exempt from this backing material requirement unless required by the manufacturer. Paper-faced backerboard may only be used behind monolithic enclosures and only if it meets ASTM mold-resistant standards ASTM D3273 or ASTM D6329.
- 14. If mold is present, effort should be made to remove all visible signs of mold using detergent or other method. If removal methods are not effective, then the material shall be replaced.
- 15. For wet-applied insulation products, follow manufacturer's drying recommendations. As guidance, EPA recommends that lumber not exceed 18% moisture content.
